Gaming

With great Powerball comes great responsibility

Throughout this note we undertake a deep dive of the upcoming Powerball game change and provide an update on the year-to-date performance of lotteries.

Key Takeaways

- Powerball's game change scheduled for next month is expected to yield positive effects. This is the main takeaway from our note. We estimate that at the 50th percentile outcome, total Powerball sales would theoretically increase by +14.3% to +27.4% if Powerball were to retain TLC's 50% to 75% price increase retention target. The reason for this is not just due to the increase in the subscription price ($1.20 to $1.40), but also due to the ability to accelerate the jackpot sequence more.
- A potential crackdown on foreign matched lotteries (such as The Lottery Office) should further benefit Powerball in particular. We believe there has been positive movement on this front based on a public statement from the Oregon Lottery, albeit likely delayed based on recent newspaper article.
- Year-to-date lotteries sales have been below consensus expectations. This is due to a slower Powerball sequence that we flagged in our FY25 preview note (see here) and an unfavorable jackpot sequence for Oz Lotto. Lotteries sales could still reach consensus expectations for 1H26 if they have a very strong jackpot run, albeit this would require above 50th percentile outcomes.
- Positive commentary from TLC's AGM regarding digital penetration. This will result in further margin expansion, especially in conjunction with lower opex growth post the Tabcorp demerger.

Changes to forecasts and valuation.

Our FY26-28 EBITDA forecasts for TLC have been revised by -1.2%/+0.6%/+0.6%. Our valuation increases by +1.7% to $5.53. Our forecasts related to Jumbo were reflected in our recently published note following their acquisition of Dream Car Giveaways (see here).

Game Change Details

Timing

At their FY25 result, TLC announced their intent to implement a game change to Powerball in November. This was ahead of schedule, as management had previously signaled their intent to implement the change in May-26. The timing is somewhat of an outlier as each of the last four game changes have been in May. Later in this note we will explore the factors that we suspect led to management's decision to accelerate their timeline.

Exhibit 1 - Recent TLC Game Changes

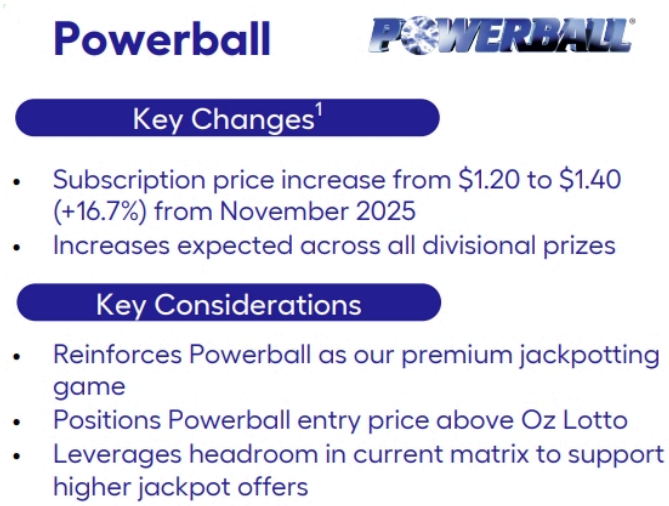

Source: Company Data

Rule Changes

- The main change to the game will be an increase in the subscription price from $1.20 to $1.40. This will result in Powerball having a higher price than Oz Lotto. Conceptually this makes more sense as Powerball is the game that more frequently has large jackpots.
- The other change is a reallocation of the prizes amongst the divisions. The new distribution takes away some of the allocation towards Div-1 and redistributes it amongst the remaining divisions. We view this as less material than the price increase.

- Management opted not to alter the underlying game math. Thus, the odds of winning each division per entry remains unchanged.

Exhibit 2 - Powerball Game Change Details

Exhibit 3 - New Powerball Prize Pool Allocations

Prize Division	Current	From Thursday 6 November 2025 (Draw 1538)
Division 1	33.50%	31.50%
Division 2	1.85%	1.90%
Division 3	2.30%	2.35%
Division 4	2.00%	2.05%
Division 5	1.50%	1.55%
Division 6	9.40%	9.65%
Division 7	7.30%	7.50%
Division 8	15.50%	16.00%
Division 9	26.65%	27.50%

Source: Company Data

Comparison vs. Previous Rule Changes

Below we compare TLC's recent game changes with a specific emphasis on Powerball:

Price Rises

- It is essentially a given that each game change will involve a price rise.
- Since covid, these increases have been rather small and generally in-line with inflation.

Game Math

- On occasion, management will more fundamentally alter the game by changing the underlining math.
  - This is usually by increasing the number of potential combinations. This will reduce the chance of a Div-1 winner and will theoretically increase the probability of achieving more large jackpots.
  - The most notable example of this was the Powerball Game Change in Apr-18. The change could be deemed a great success and one of the reasons why Powerball has become the dominant game in TLC's portfolio, in conjunction with its brand repositioning as the big jackpot game and skew towards younger players.
- Management commentary indicates that they don't want players to become disenfranchised with the smaller jackpot sizes and that they still believe there is room for growth in Powerball. Hence, they opted not to alter the game math.
  - Given Powerball has continued to grow since the initial game change, and at a faster rate than the other games within the portfolio, there appears to be some merit to this hypothesis.

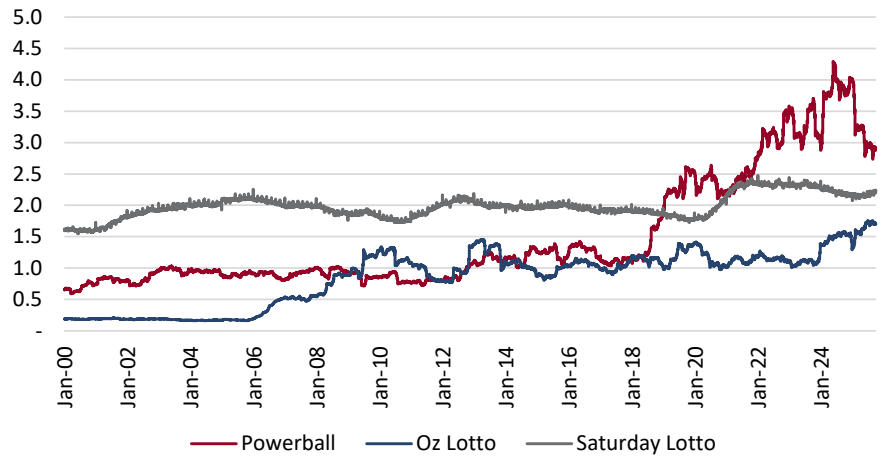

- That said, in the later sections we will explain how we expect the game change to result in larger jackpots despite the jackpot odds staying the same.

Exhibit 4 - Summary of Recent Game Changes

Game Change Impact

Like-for-Like Jackpot Entries

Typically, price increases will result in fewer entries for each Like-for-Like (LFL) jackpot. This is usually some combination of players not wanting to increase their overall lotteries spend or because they feel like they are getting less value for the same Div-1 jackpot prize.

However, the decline in entries has historically been less than the corresponding increase in ticket price; i.e. some in-elasticity of demand. The extent is a function of each individual player's psyche; whether they purchase say 10 tickets or $10 worth of tickets. We suspect the majority of players lean toward the former given:

- TLC purchase options are by entries not price.
- Players cannot physically purchase exactly $10 worth of tickets.
- Many players buy the PowerHit entry (20x tickets with guaranteed Powerball).
- Players wouldn't want to reduce their chances of winning.

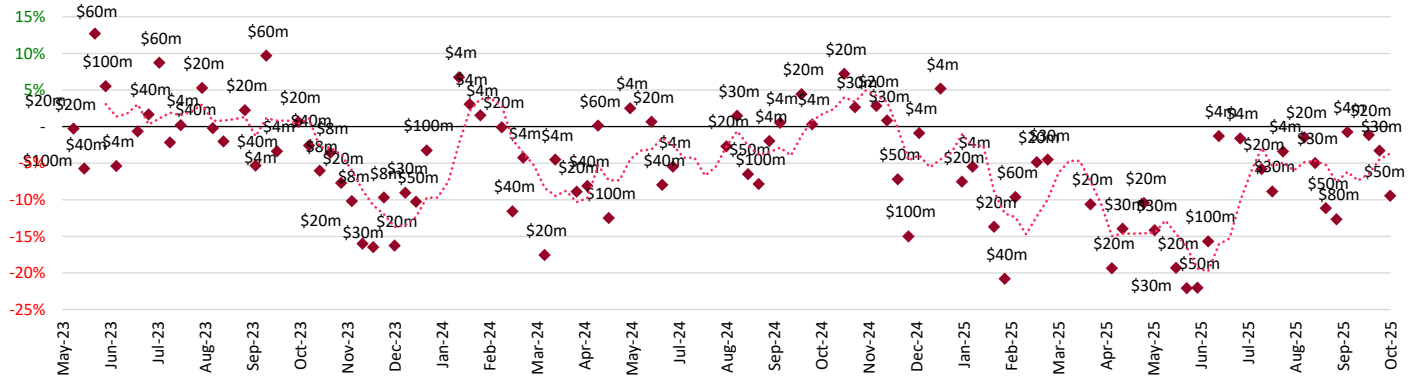

Partly offsetting the price increase is the reallocation of prizes towards the lower divisions.

- This should result in slightly more reinvestment of low level prizes.
- Current prizes for divisions 6-9 are all under $100 and cumulatively account for 60.65% of the prize allocation.

Below is a chart that we previously introduced to explore the impact of the May-23 game change (10c price increase), but now use to explore short-medium term consumer behavior as well.

- Initially, LFL entries appeared to remain robust despite the price increase, with no evidence of consumer resistance.
- However, in late October-23, LFL entries began to deteriorate relative to their pre-game-change levels.
- LFL entries then saw a remarkable recovery in Feb-24 following the record $200m draw before declining again.
- Since then, LFL entries have been volatile, but overall weaker, particularly in April & May 2025. This lull could be driven by the extended accelerated sequence (discussed later) or cannibalisation from Oz Lotto, which achieved back-to-back $70m jackpots in April/June.

Exhibit 6 - Change in Powerball Like-for-Like Jackpot Entries post May-23 game change vs. the 12 months pre gamechange

Source: Company Data, E&P Estimates. Note: excludes jackpots with fewer than three data points in the prior period. Comments are like-for-like jackpot size.

Jackpot Probabilities

Although the game change has not altered the odds of winning Powerball prizes, any reduction in entries will reduce the probability of a Div-1 winner. Below we demonstrate the impact of this using the average entries at each LFL jackpot since the May-23 game change. We have compared these to a scenario where TLC retains 50% of the price increase (i.e. -8.3% decrease in entries) & 0% of the price increase (-16.7% decrease in entries).

- For the $4m jackpot, the probability of the individual jackpot going off has averaged 14.1%. If entries were to drop by the same amount as the price rise (-16.7%), the probability of a Div-1 jackpot winner would decrease to 11.9%.
- Although this -2.2% increase may seem small, the probabilities become increasingly material over an entire sequence. In fact the probability of reaching the $200m jackpot from the sequence below (most common sequence) doubles from 1.3% to 2.7%.

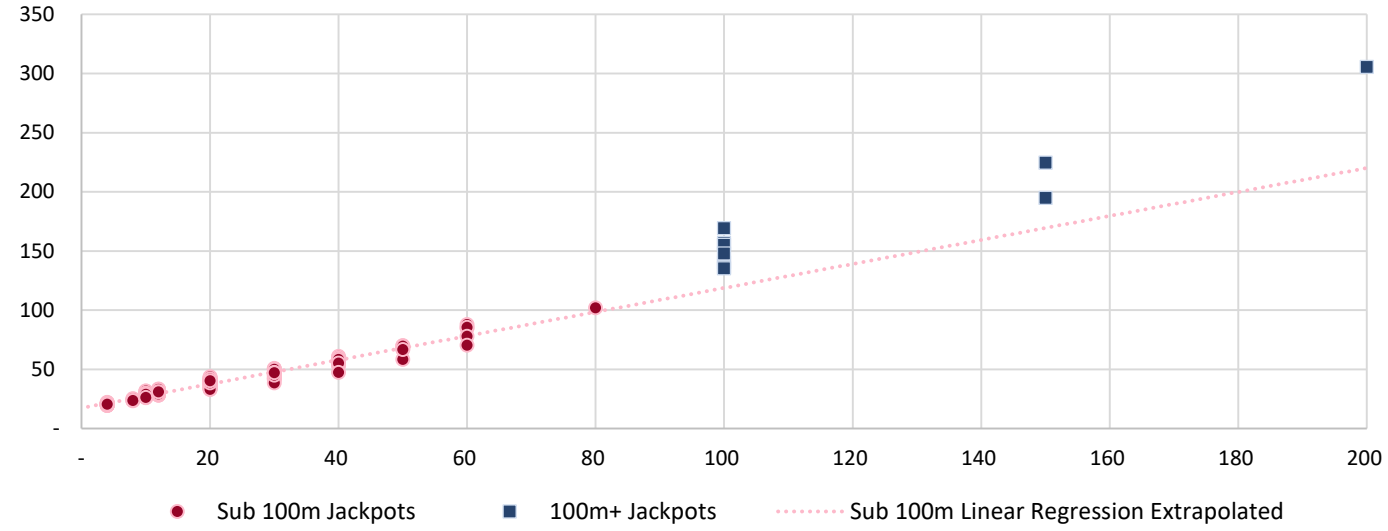

Exhibit 7 - Powerball Probabilities based on Entries

Jackpot Frequency		Entries			Probability of the Individual Jackpot going off			Probability of reaching the Jackpot within the Sequence		
Jackpot	Count	0.0%	-8.3%	-16.7%	0.0%	-8.3%	-16.7%	0.0%	-8.3%	-16.7%
4,000,000	21	20,438,792	18,735,559	17,032,326	14.1%	13.0%	11.9%	100.0%	100.0%	100.0%
12,000,000	19	30,660,439	28,105,402	25,550,365	20.4%	18.9%	17.3%	85.9%	87.0%	88.1%
20,000,000	26	38,620,364	35,402,000	32,183,637	25.0%	23.1%	21.3%	68.4%	70.6%	72.9%
40,000,000	9	55,803,796	51,153,480	46,503,163	34.0%	31.6%	29.2%	51.3%	54.3%	57.4%

100,000,000	7	148,644,979	136,257,897	123,870,816	66.9%	63.7%	60.2%	18.5%	21.3%	24.5%
150,000,000	2	209,612,053	192,144,382	174,676,711	79.0%	76.0%	72.7%	6.1%	7.7%	9.8%
200,000,000	1	305,330,546	279,886,334	254,442,122	89.7%	87.5%	84.9%	1.3%	1.9%	2.7%

Source: Company Data, E&P Estimates. Note: Includes WA.

Reaching $100m+ jackpots also appears to carry extra appeal to customers. Historically there is strong linear relationship between the jackpot size and the number of entries. However, since Covid, every $100m+ jackpot size has generated a premium above this trendline.

Prize Reserve Fund / Sequence Acceleration

The final impact of the game change is on the prize reserve fund. This requires a deeper understanding of the underlying game math to properly appreciate. For a full deep dive, we recommend that you revisit our initiation Burger with The Lott.

Before going through the math, we try and briefly conceptualize what we believe many people may overlook:

- We suspect that most may initially conclude if you increase the price of Powerball by an amount (say 10%), and the number of entries remain the same after the price increase, then overall Powerball would theoretically gain 10% more sales.
- This is true for each individual draw, but incorrect over an extended period.
- The reason for this is that Powerball would accumulate more prize reserves than it did prior to the price rise, which will eventually allow for the sequence to be accelerated.

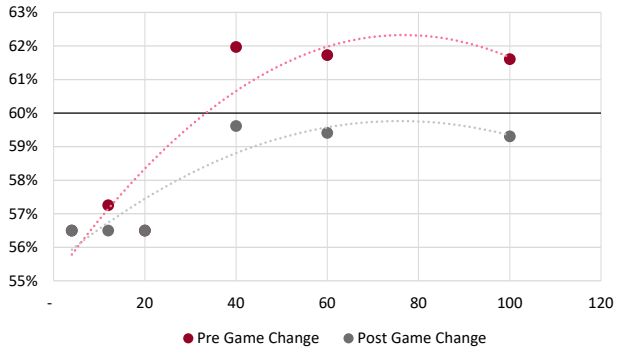

Below we will show how this works in practise with the game change. Some of the basic concepts to understand the chart are as follows (see initiation for full explanation):

- Powerball must pay out 60% of its subscriptions in prizes over the long term.
- Each individual sequence must pay out a minimum of 56.5% of its subscriptions (TLC can alter this number). If the advertised Div-1 jackpot is not enough to reach this figure, the jackpot must be "topped up". There is no ceiling on what the payout can be per sequence.
- Any sequence that pays out >60% will deplete the prize reserve fund. Anything below 60% will increase the prize reserve fund.
- Whether there is an accumulation depends on how many entries the draws are achieving (LFL jackpot entries), the prize allocations by division & the speed at which the Div-1 jackpots increase (i.e. sequence used).

In the chart below we have shown the impact of the game change, using the average entries since the beginning of FY25 and the most frequent sequence used. For this example, we have just compared the known rule changes (i.e. subscription price from $1.20 to $1.40 & the allocation of the prize pool towards Div-1 from 33.5% to 31.5%) and kept LFL entries consistent. We can observe the following:

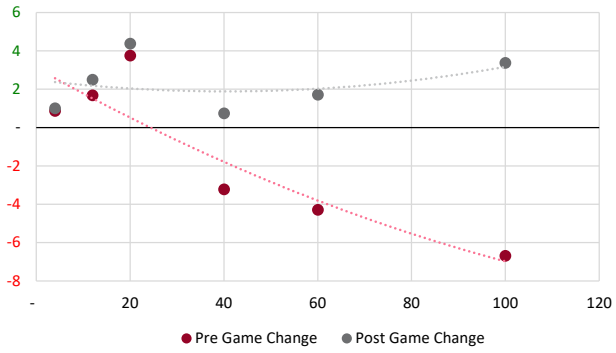

- The post-game-change payout ratios are always lower than pre game change, except for the $4m & $20m jackpots that were already at the minimum sequence payout of 56.5% (i.e. these are topped up and will therefore have Div-1 prizes that are >$4m/$20m).
- Post game change, all the jackpots will result in a net prize fund accumulation. This will allow management to accelerate the sequence more (discussed further below).
- Although two jackpots can have the same sequence payout ratio (e.g. the $60m & $100m are very close), the larger the jackpot size, the greater the prize reserve fund will accumulate/deplete in terms of raw dollars.

Exhibit 9 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Cumulative Sequence Payout ratio (%, y-axis) - No LFL entry decline

Source: Company Data, E&P Estimates. Note: Includes WA

Exhibit 10 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Net Prize Fund Accumulation (A$m, y-axis) - No LFL entry decline

Source: Company Data, E&P Estimates. Note: Includes WA

As discussed previously, we typically see some drop off in LFL jackpot entries whenever there is a price increase.

- However, we don't expect this to be the full amount of the price increase.
- Management are targeting a 50% to 75% retention rate over time, in-line with the historical range they have observed.
- If this were to materialize, the prize reserve impacts would still be more favourable, but to a lesser extent.

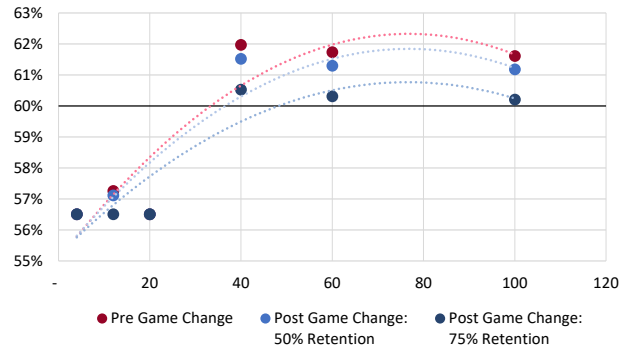

Based on our forecasts & historical payouts, we would recommend that TLC increase the beginning jackpots above $4m.

- This is because every $4m jackpot post covid has required a top-up and had an average payout of $4.68m.
- As it turns out, management have already observed this and have marketed to players that the new minimum jackpot will be $5m.

The other jackpot you could question based on the sequence represented in the charts is the $20m jackpot.

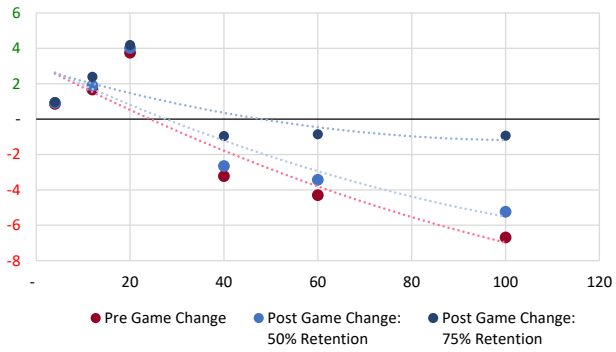

- Since the game change in Mar-23, two out of the three $20m jackpots have required a top-up.
- The dilemma is that $30m would be too big of a jump, and the current $20m jackpot may be deemed a 'cleaner' number than $25m.

Exhibit 11 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Cumulative Sequence Payout ratio (%, y-axis) - Base Sequence

Source: Company Data, E&P Estimates. Note: Includes WA

Exhibit 12 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Net Prize Fund Accumulation (A$m, y-axis) - Base Sequence

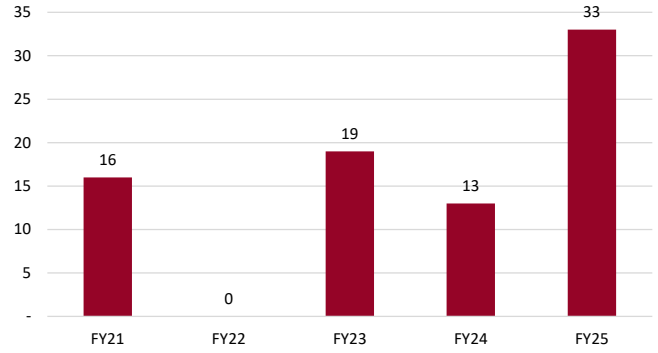

Source: Company Data, E&P Estimates. Note: Includes WA

Over the medium-long run, the prize reserve fund will either appreciate or depreciate and management will either need to accelerate or decelerate the jackpot sequence. TLC have considerable flexibility when making these changes. The most glaring example of this was during FY25, in which management accelerated the Powerball sequence for 33/52 weeks. This was far more than any of the previous four years.

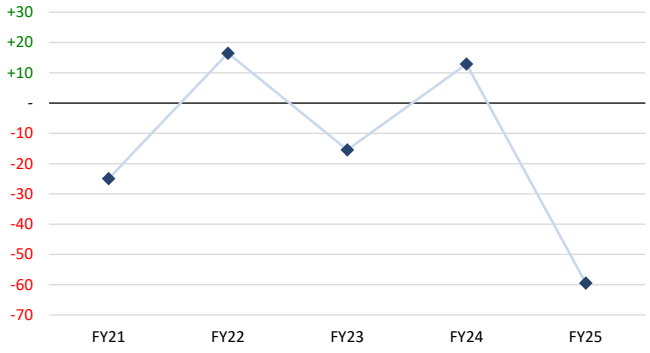

Acceleration is good for achieving higher theoretical sales outcomes, because you increase the probability of reaching larger jackpots throughout the year. However, acceleration usually depletes the prize reserve fund. This is because there are typically not enough entries throughout the sequence to support the advertised Div-1 jackpot. Thus, the prize reserve fund depleted in FY25 more than in any of the previous four years.

Exhibit 13 - Number of Weeks using the Accelerated Powerball Sequence

Source: Company Data, E&P Estimates

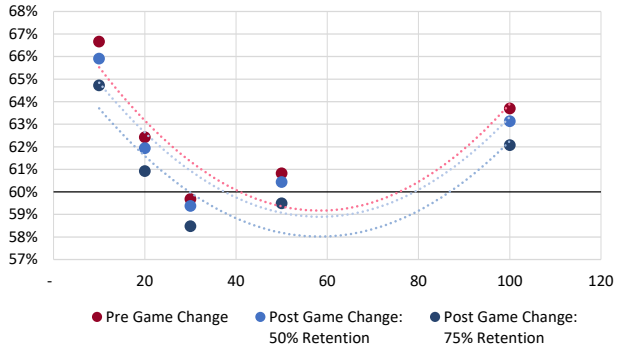

Exhibit 14 - Powerball Net Prize Reserve Fund Accumulation (A$m)

Source: Company Data, E&P Estimates. Note: Includes WA

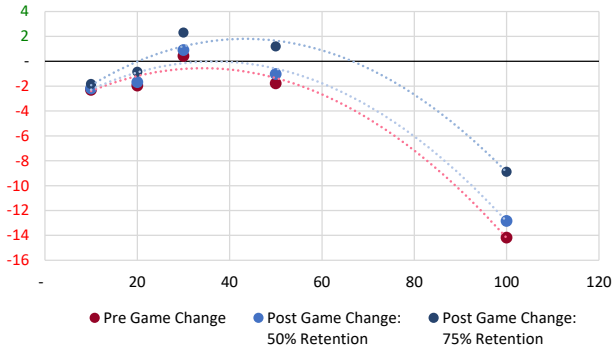

Below we show the same charts that demonstrate the theoretical impact to the prize reserve fund, but this time using the accelerated jackpot sequence. In this sequence, the majority of the Div-1 winning jackpots are expected to deplete the prize reserve fund, except for the $30m jackpot.

Exhibit 15 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Cumulative Sequence Payout ratio (%, y-axis) - Accelerated Sequence

Source: Company Data, E&P Estimates. Note: Includes WA

Exhibit 16 - Theoretical relationship between Powerball's winning Div-1 Jackpot (A$m, x-axis) and the Net Prize Fund Accumulation (A $m, y-axis) - Accelerated Seqeunce

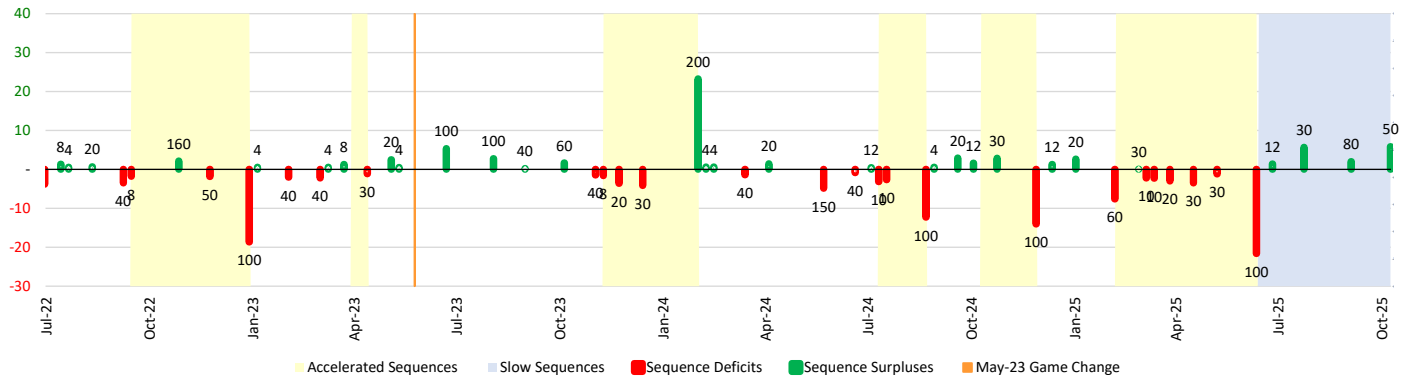

Source: Company Data, E&P Estimates. Note: Includes WA

Below, we demonstrate the accumulation/depletion of the prize reserve fund for each sequence over the past three years.

- The majority of base sequences have resulted in net sequence prize fund accumulation.
- On the contrary, only 4/21 accelerated sequences have resulted in a net accumulation. These include the two largest jackpots ($160m & $200m), plus two of the $30m jackpots that we indicated above.

Exhibit 17 - Powerball Net Sequence Prize Reserve Fund Accumulation (A$m) - jackpot as label (A$m)

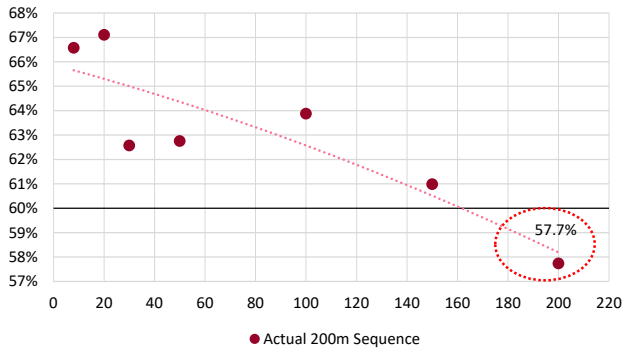

Source: Company Data, E&P Estimates. Note: Includes WA

We note that the very large jackpots over $100m+ often have wide variations in payout. The record $200m sequence is an excellent example.

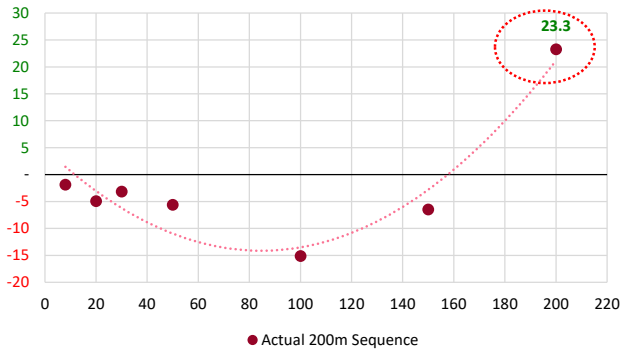

- Despite using the accelerated sequence, it was the largest net prize fund accumulating sequence in the above sample.
- However, had the jackpot gone off at any prior draw within the sequence, then there would have been a negative net sequence deficit for the prize reserve fund.

Exhibit 18 - Powerball's Payout Ratio's (%, y-axis) based on the Div-1 winning Jackpot (A$m, x-axis) - $200m sequence ending 1-Feb-24

Source: Company Data, E&P Estimates. Note: Includes WA

Exhibit 19 - Powerball's Sequence Surplus/Defecit (A$m, y-axis) based on the Div-1 winning Jackpot (A$m, x-axis) - $200m sequence ending 1-Feb-24

Source: Company Data, E&P Estimates. Note: Includes WA

Below we have considered the above charts for the record $200m sequence, but also considered the probability of each jackpot being the winning jackpot.

- Although very unlikely (1.5%), the $200m jackpot was very favorable. This is not only due to the large amount of ticket sales, but also for building up the prize reserve fund.
- Had this event not occurred, we believe TLC would not have been able to accelerate the sequence as much they did in FY25.

Exhibit 20 - Powerball's Weighted Average Net Prize Reserve Fund Surplus/Defecit - $200m sequence ending 1-Feb-24

Prize Reserve Impacts from the Record $200m Powerball Draw						
Jackpot	Entries	Probability of Jackpot going off	Probability of reaching Jackpot	Probability of being the Winning Jackpot	Sequence Surplus/Deficit if Jackpot	Probability Weighted Surplus/Deficit
8,000,000	23,530,718	16.1%	100.0%	16.1%	-1,854,953	-297,741
20,000,000	34,197,531	22.5%	83.9%	18.8%	-4,924,268	-928,142
30,000,000	45,025,587	28.5%	65.1%	18.5%	-3,165,836	-586,367
50,000,000	67,199,003	39.3%	46.6%	18.3%	-5,616,816	-1,028,868
100,000,000	155,083,141	68.4%	28.3%	19.3%	-15,116,854	-2,923,678
150,000,000	224,519,188	81.2%	8.9%	7.2%	-6,483,668	-469,443
200,000,000	305,330,546	89.7%	1.7%	1.5%	23,253,405	350,369
-	-	-	0.2%	-	-	-
					Weighted Average	**-5,883,870**

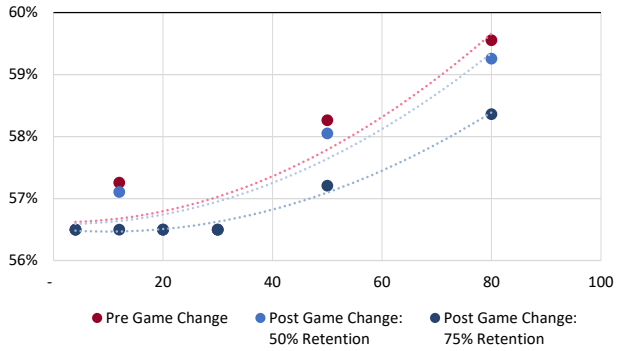

Source: Company Data, E&P Estimates. Note: Includes WA

On the contrary, the June-25 $100m jackpot was the biggest net prize fund deficit sequence in the sample.

- Following this, management slowed the sequence down.
- However, rather than reverting to the base sequence, they slowed the sequence down even further.
- This results in a sequence that is expected to result in net prize fund surpluses no matter the winning jackpot.

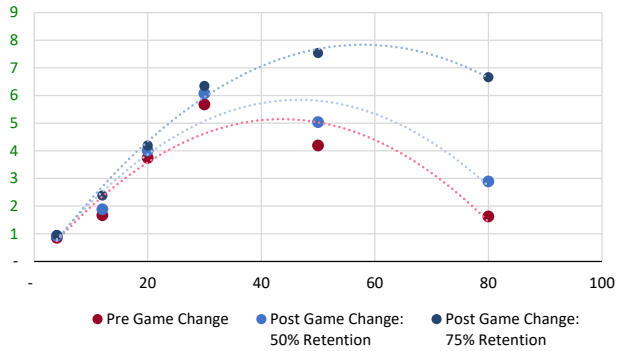

The need to slow the sequence down was something that we flagged in our FY25 result preview (see here). This was also the reason that we have been sitting below consensus for FY26 for quite some time. However, we note that this is purely a short-term view.

Monte Carlo Simulation

Using our Monte Carlo simulator, (which we first introduced in Burger with The Lott), we can combine the impact of these factors and determine the range of outcomes to account for the jackpot randomness. We estimate that at the 50th percentile outcome, total Powerball sales would theoretically increase by +14.3% to 27.4% if Powerball were to retain TLC's 50% to 75% price increase retention target.

We note that this is not a growth forecast for FY26, as we are attempting to isolate the specific theoretical impacts of the game change.

- We would argue that YoY growth is not a good indicator of the impacts of the game change, as FY25 was an unlucky year for Powerball that we estimate finished in the 6th percentile.
- Below we have run a 10-year simulation for each of the scenarios we have discussed above. This is to reduce the impact of the starting parameters such as the starting jackpot & prize reserve fund. Both of these parameters will skew short-term outcomes, but will have less impact over a longer simulation.

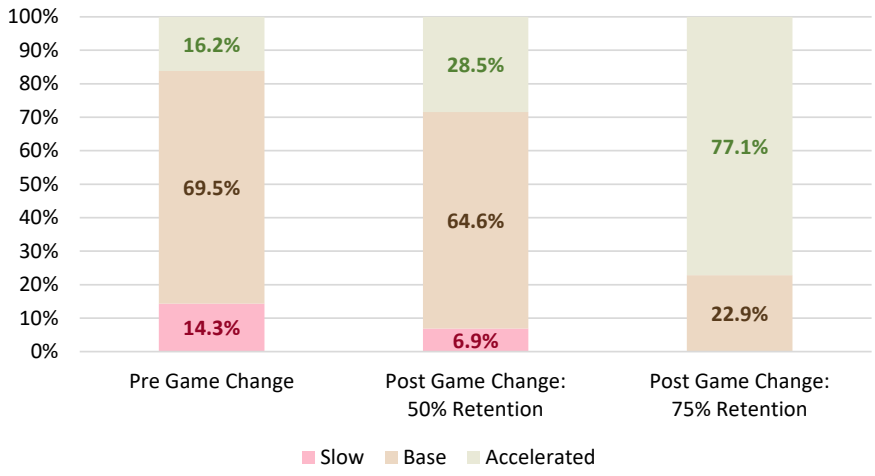

Exhibit 23 - Powerball Monte Carlo Simulation Scenarios - Sales (A$m, y-axis), percentile outcome (#, x-axis)

Source: Company Data, E&P Estimates. Note Includes WA.

A key driver of growth is from a stronger prize reserve fund. This will in turn facilitate more sequence acceleration. Below we have shown the expected proportion of weeks that would use each of the three sequences. We expect that the 75% retention scenario would allow for considerably more sequence acceleration, albeit the 50% retention scenario would also be beneficial vs. the current baseline.

Exhibit 24 - Powerball Monte Carlo Simulation Scenarios - Proportion of Weeks spent using each Sequence

Source: Company Data, E&P Estimates. Note Includes WA.

Foreign Matched Lotteries

Scale

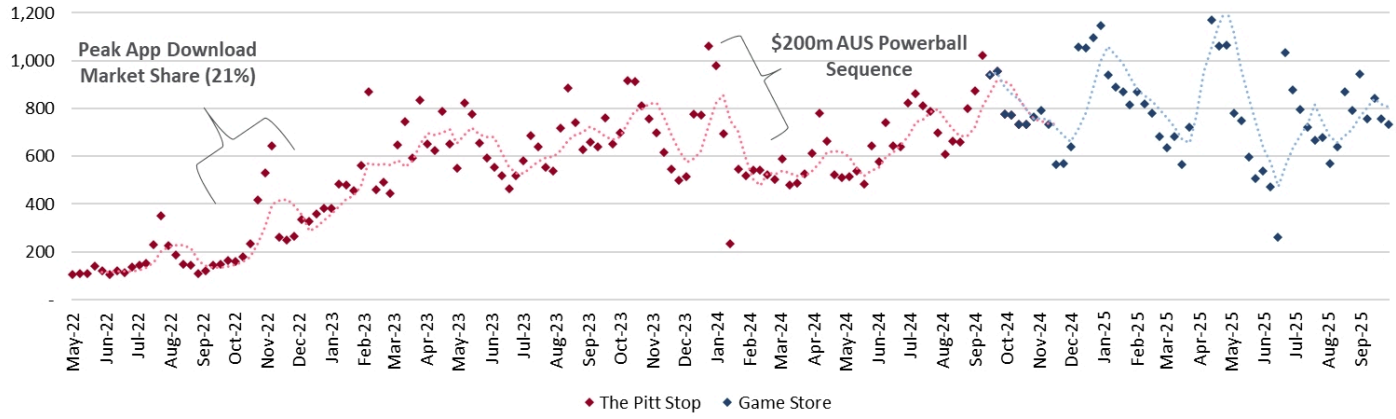

Last year we did a deep dive into the largest foreign matched lottery operator The Lottery Office (TLO, see here).

- We estimated that TLO represented ~3.3% of Australian digital lottery sales or ~1.5% of total sales from any platform.
- We also theorized that if TLO was to cannibalize any Australian game, it would most likely be Powerball. This is because TLO players are likely attracted to high-risk high-reward games with large jackpots.

We estimate that TLO sales appear to have been relatively flat over the past 2.5 years, albeit with reasonably high volatility.

- For the US games, comparing LFL entries is difficult, as their game rules tend to yield inconsistent jackpot sequences.
- However, the chart below attempts to partially solve this problem by simply dividing the TLO's affiliate retailer sales by the average size of the US Powerball & Mega Millions jackpots throughout the week.

Exhibit 25 - The Pit Stop Sports Bar & BBQ Grill + Game Store Weekly Lottery Sales divided by the US Powerball & Mega Millions Jackpots (US$m)

Source: Oregon Lottery, US Powerball, US Mega Millions, E&P estimates. Note: US Jackpots are the average combined size throughout the given week.

At their FY25 result, TLC made some comments that indicate positive movement on potential regulation. These included the following:

- In the Northern Territory, a new minimum 50% tax rate, less GST has been introduced on profits from lottery ticket reselling and matching activities.
- In the US, The Oregon Lottery is moving to ban sales via courier services to customers outside the state.
- The World Lottery Association has also raised concerns about courier services, warning that they undermine regulated lottery markets.

We believe there is some momentum towards a crackdown, given the Oregon Lottery publically announced its intended rule changes (see here) following pressure from the Powerball & Mega Millions consortium.

- However, a recent article in the Oregon Live newspaper (see here) indicated that the vote for new rules had been delayed, which would push the potential effective date into next year.

Any crackdown would be a positive catalyst for TLC & Jumbo.

- We would expect a minor uplift in LFL jackpot entries, increased digital penetration, a reduction in advertising competition and a reinforced status as a monopoly operator / reseller.
- However, at this stage, we are still wary that TLO and other resellers could find alternative loopholes or other potential states that could prolong their courier services.
- Thus, we have not assumed any uplift to LFL entries in our forecasts, but remain wary of this potential catalyst, particularly for Powerball.

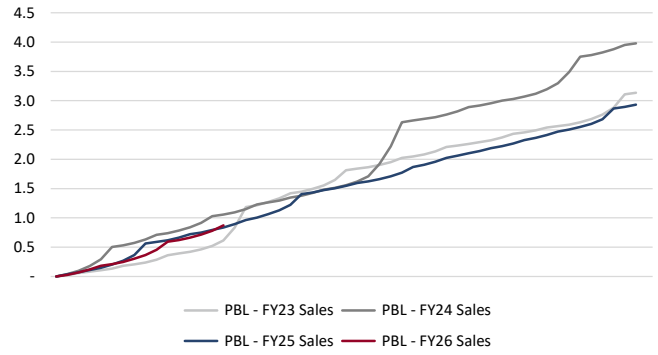

Quarterly Update

Lotteries Performance

Overall, lotteries sales have been somewhat soft to start FY26 and tracking below consensus expectation.

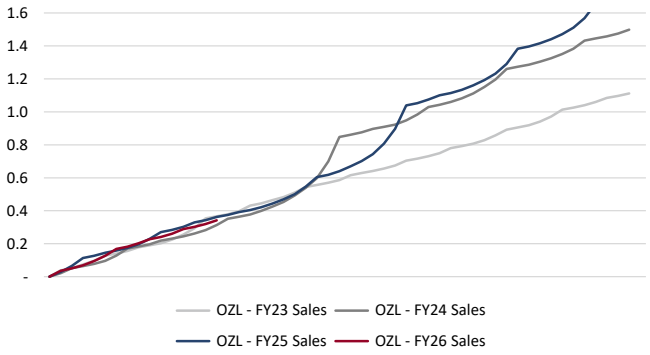

- Powerball has been tracking in-line with FY25. However, FY25 was a very unlucky year that we estimate was in the 6th percentile. FY26 has seen much better luck, but has been impacted by the slower sequence that we discussed above and flagged in our FY25 preview note (see here).
- Oz Lotto has been unlucky in FY26, only reaching $30m once. From a year-to-date sense, it is in-line with the previous two years. However, both FY24 & FY25 had a very strong 2H.
- We also believe that the YoY comparisons for FY26 slightly underestimate the performance. This is because both the Powerball & Oz Lotto jackpots recently went off.

AGM Feedback

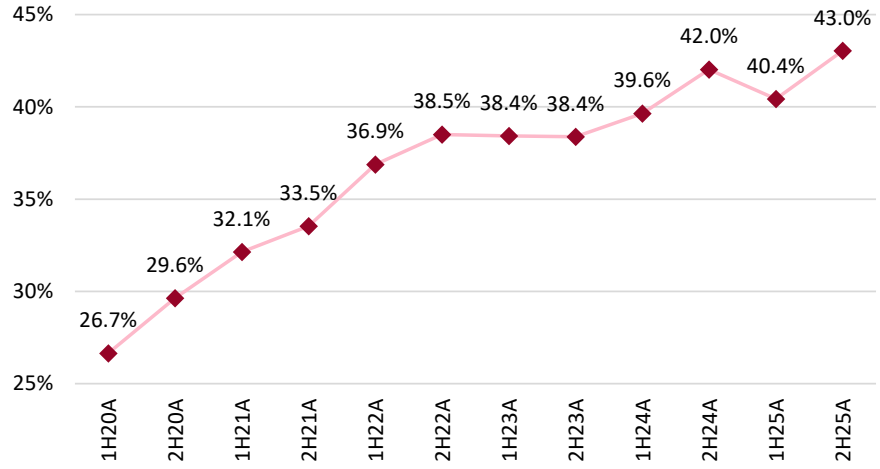

TLC had their AGM last Wednesday. The main takeaway was a comment for their FY26 Outlook - "Continued digital share growth and further productivity gains should also support further margin expansion."

This is positive commentary given the significant margin uplift from digital sales vs. retail sales. We explain the unit economics of a lottery ticket in our note that explored the potential Victorian Lottery Licence renewal (see here).

Below we chart TLC's digital penetration over time:

- Growth in the digital channel was likely accelerated due to COVID but was then flat for a period post 2H22.
- Growth then resumed for the last three halves, but this was partly aided by the introduction of in-store syndicates (which are treated as digital) and the record $200m Powerball draw benefiting 2H24.
- 2H25 digital penetration was a record number and was the primary driver behind the result beat vs. consensus expectations and strong share price reaction. The figure could be an indicator that the post-COVID plateau is over, and we are returning to a period of consistent growth, albeit slower than pre-COVID.

Exhibit 30 - TLC Digital Penetration

Source: Company Data, E&P Estimates.

Changes to Forecasts

TLC

- Marginally increased our medium/long term Powerball forecasts. We had already factored in the benefits of the Powerball game change conceptually but had not fully done our calculations. However, we do expect some partial cannibalisation of the other games within the portfolio.
- Downgraded 1H26 Lottery Retailing to reflect the weaker jackpot sequence.
- Upgraded our Digital Penetration forecasts. We had assumed modest digital penetration growth due to a weaker jackpot sequence but the above AGM commentary appears more positive.

Jumbo

We recently published a note on Jumbo following their acquisition of Dream Car Giveaways (see here). In that note, we had already factored in the conclusions drawn from this note into our earnings revisions. Thus, we make no changes to our financial forecasts for Jumbo. We did however forget to list that we updated our numbers to include Jumbo's recent SaaS agreement with RSL Queensland (see here).

This has resulted in the following revisions to our forecasts and valuation to TLC. We retain our neutral recommendation.

Exhibit 31 - TLC changes to financial forecasts

		FY26E	FY27E	FY28E
Revenue	**New**	**3,760.5**	**3,955.5**	**4,113.7**

RESEARCH RECOMMENDATION DEFINITIONS

Positive	Stock is expected to outperform the S&P/ASX 200 over the coming 24 months.
Neutral	Stock expected to perform in line with the S&P/ASX 200 over the coming 24 months.
Negative	Stock is expected to underperform the S&P/ASX 200 over the coming 24 months.
Speculative Buy	Stock has limited history from which to derive a fundamental investment view or its prospects are highly dependent on event risk, e.g. Successful exploration, scientific breakthrough, high commodity prices, regulatory change, etc. Consequently, the stock is considered a high-risk investment which may be prone to high volatility in share price movements, have a greater risk of capital loss and/or the stock may have low liquidity.
Suspended	Stock is temporarily suspended due to compliance with applicable regulatory and/or E&P policies in circumstances where E&P is acting in an advisory capacity.
Not Rated	Stock is not included in our investment research universe.

Research Criteria Definitions

Recommendations are primarily determined with reference to how a stock ranks relative to the S&P/ASX 200 on the following criteria:

Valuation	Composite of Rolling 12-month prospective multiples and discounted cash flow (DCF), or DCF for resource stocks.
Earnings Outlook	Forecast 2-year EPS growth.
Earnings Momentum	Percentage change in the current consensus EPS estimate for the stock (rolling 1-year forward basis) over the consensus EPS estimate for the stock 3 months ago.
Shareholder Returns	Composite of forecast ROE (rolling 1-year forward basis) and the percentage change in ROE over 2 years.
Debt Servicing Capacity	Rolling 12-month EBIT Interest Cover ratio.
Cyclical Risk	Qualitative assessment of the 2-year outlook for a stock/industry's profit cycle.
Industry Quality	Qualitative assessment of an industry's growth/returns potential and company specific management capability.
Financial Transparency	If we don't understand it, we won't recommend it.

For stocks where Evans and Partners does not generate its own forecasts, Bloomberg consensus data is used. Analysts can introduce other factors when determining their recommendation, with any material factors stated in the written research where appropriate.
